Jo Reardon – IMY 210

Unit Assignment 3

_____

Working on this assignment gave me a solid introduction to modern web development using Nuxt.js and Strapi. I gained hands-on experience with Jamstack principles and the benefits of using a headless CMS, as well as the flexibility of file-based routing and dynamic content rendering in Nuxt.

The most challenging part of the project was setting up and configuring Docker. While I managed to get both my Nuxt and Strapi applications working locally, containerizing them and ensuring they ran correctly in isolated environments proved more difficult than expected. Issues with network configuration, volumes, and exposing ports took longer to resolve than anticipated. I had to consult documentation and several forums to understand how Docker manages inter-container communication, particularly when working with services running on different ports.

Despite these hurdles, I now have a much better understanding of how Docker works, especially in the context of full-stack applications. I also learned the importance of .dockerignore files and environment variables when preparing a project for deployment.

Overall, this assignment taught me how to integrate APIs manually, how to work with content types and permissions in Strapi, and how to fetch and render data dynamically in Nuxt. While the Docker aspect was tough, the rest of the project gave me a solid confidence boost in building modern, API-driven web apps.
